HEAVY RAIN — 5-Minute Stage Demo Script & Visual Run-of-Show

Unified Pitch & Screen Walkthrough • Synced 100% to Dom's Latest Push (`5a968f0`) & Your Persona Workspace (`c059a93`)

`YOUR UI: HTTP://LOCALHOST:5173` `DOM CONSOLE: HTTP://127.0.0.1:43170 (BUILD | APPS)`

`DOM RELAY API: HTTP://127.0.0.1:43180` `AUGI 3D STUDIO: HTTP://127.0.0.1:43171`

1. PROVE THE IDEA (THE PROBLEM)

Sam Altman: "Fast Fashion Era of SaaS"

Sam Altman said *"we are entering the fast fashion era of SaaS very soon"*—custom tools can be spun up on demand, **but** DIY vibe-coding creates disposable "slopware" that breaks after one wear. Like the Dot-Com era when every business needed a website even though owners weren't web developers, every worker needs custom workflow software—and you can't hire 1 human SWE per employee.

2. WHY NOW & WHAT OUR PLATFORM DOES

From Tracking Clicks → Reading Thoughts

Old RPA / "system supervisor" tools only tracked mouse clicks inside rigid SaaS. Today, work happens in **Claude, ChatGPT, and Gemini**, where employees **write down their exact thought process**. Our autonomous **Gemini 4 Argon** builder runs in a hosted **Antigravity Sandbox (4 vCPU, 16 GB Linux)** with org-wide context, API keys, and UI/security rules.

3. PROVE IT WORKS (HIGH-VALUE OUTPUT)

Partner Finance ROI + Zero-Slop 3D Studio

- **Meridian Crest Capital (Marcus Vance):** Live-builds **DealPulse AutoBrief & Post-Call Loop** in `:43170`, saving 9.2 hrs/wk ($69k/yr per partner; $274k/yr across the 5-person pod).
- **AUGI (Lukas Lindner):** Switches org to `AUGI` and compiles **Sable Studio & Sable Balance** (`:43171`)—a working Three.js 3D chassis & CoG engineering studio.

BEAT / TIME	SPEAKER	ACTIVE SCREEN & URL	WHAT'S HAPPENING ON SCREEN	FRAMEWORK GOAL
BEAT 1 0:00 – 1:05	YOU	**HeavyRain UI** http://localhost:5173	Select **Marcus Vance** (Meridian Crest Capital). Click **Auto-Play** on his 7-step VeloceAI loop (Outlook → Affinity → News → Claude → Granola → Gemini → Email).	**The Problem & Why Now:** Sam Altman's "Fast Fashion Era of SaaS" + Dot-Com website analogy; shift from tracking clicks to reading written thought processes.
BEAT 2 1:05 – 2:05	YOU	**HeavyRain UI** http://localhost:5173 → :43170	Click **Signal vs. Noise & Stack-Ranker** (0% Airbnb purged vs 98% Partner Loop), then click **Send to Dom's Live Builder (:43170)**.	**What Can We Fix & Why Not Vibe-Code:** Partner hour ROI ($69k–$274k/yr); why DIY vibe-coding creates insecure AI slop without API keys or org context.
BEAT 3 2:05 – 3:25	DOM	**Heavy Rain Console** http://127.0.0.1:43170 (Build | Apps)	Meridian Crest Capital wakes from *"Waiting for work"* → dark fogbound terrain → streams **Builder steps as they happen** + 5 **Background build** phases → **Preview ready**.	**What Our Platform Does:** Hosted Antigravity agent (gemini-4-argon, 4 vCPU / 16 GB Linux) builds **DealPulse AutoBrief & Post-Call Loop** live.
BEAT 4 3:25 – 4:10	DOM & YOU	**DealPulse App** (:43170) + **Rookmere Close** (:43173)	Click **Open application** on the finished DealPulse AutoBrief & Post-Call Loop card & show Apps catalog + team reuse (Elena 68%, Priya 62%, Rookmere Close).	**Prove It Works (Part 1 — Finance ROI):** 42m scramble → 90s; deterministic trial-balance/FX/covenant checks; $274k/yr pod ROI.
BEAT 5 4:10 – 5:00	DOM & YOU	**Console (Org: AUGI)** → **Sable Studio** (:43171)	In :43170 click ··· → Organization → AUGI, show **Lukas Lindner** weekly cycle & Apps, then open 3D **Sable Studio** (:43171) & **Sable Balance**.	**Prove It Works (Part 2 — Zero AI Slop):** Purpose-built Three.js 3D SUV chassis & CoG engineering studio with analytical guardrails.

BEAT 1 • 0:00 – 1:05 (65 sec) • SPEAKER: YOU

The Problem & "Why Now": Beyond the "Fast Fashion Era of SaaS"

SCREEN: HTTP://LOCALHOST:5173 (SPLIT DEMO)

FRAMEWORK GOAL: Introduce Sam Altman's *"fast fashion era of SaaS"* quote + the Dot-Com website analogy. Explain why autonomous enterprise software is suddenly possible right now: work shifted from clicking buttons in rigid SaaS (where old tools only saw mouse clicks) to writing down full thought processes in Claude, ChatGPT, and Gemini.

🖥️ WHAT'S ON SCREEN & CLICK CUES — MARCUS VANCE • MERIDIAN CREST CAPITAL

- Start on `http://localhost:5173` with **Marcus Vance** (*VP, Deal Sourcing & Screening* at **Meridian Crest Capital**) selected.
- Click **Auto-Play** so the audience sees Marcus jumping across 7 disconnected tools (`Outlook Calendar → Affinity CRM → Google News → Claude 3.7 Skill → Zoom + Granola → Gemini 4 → Email`).

🎙️ WORD-FOR-WORD SPOKEN TALK TRACK

• 0:00 – Sam Altman's "Fast Fashion Era of SaaS" & The Dot-Com Analogy

"Sam Altman recently said *'we are entering the fast fashion era of SaaS very soon'*—a world where custom software for a specific workflow can be spun up in hours instead of buying rigid, one-size-fits-all SaaS. Think back to the Dot-Com era: every company suddenly needed a website, and people were great at running their business, not hand-coding HTML. Today, we have the exact same bottleneck with internal software: people are deeply technical at their actual jobs, but they aren't software engineers. And you obviously can't hire a dedicated human software engineer to sit next to every single employee—that will never scale."

"Even worse, just like fast fashion in retail, when employees try to 'vibe-code' their own tools in chat, you get disposable AI slop that falls apart after one wear—no API keys, no security, and zero sustainability."

• 0:28 – Why Now? Shift #1 (Clicks → Written Thought Processes) & Shift #2 (Personal Autonomous SWE)

"So why hasn't autonomous, sustainable workflow software worked before, and *why is it suddenly possible right now*? Two massive shifts just converged:"

"First, work has shifted from clicking buttons inside rigid, purpose-built SaaS tools to reasoning inside Claude, ChatGPT, and Gemini. Under the old paradigm, 'system supervisor' tools had to track mouse clicks—and clicks only tell you *where* someone clicked, never *why*. Today, as workers prompt AI assistants across their workflow, they are literally writing down their entire thought process, business logic, and intent in plain English."

"Second, with Gemini 4 Argon running inside autonomous sandboxes, we don't just suggest another prompt—we give every employee a *Personal Autonomous Software Engineer* that turns their written thought process into sustainable, enterprise-grade applications."

BEAT 2 • 1:05 – 2:05 (60 sec) • SPEAKER: YOU

What Can We Fix? Partner ROI & Live Dispatch to Dom's Builder

SCREEN: LOCALHOST:5173 → SEND TO :43170

FRAMEWORK GOAL: Quantify the high-value Partner time problem (saving an investment partner 1 hr/wk = tens of thousands of dollars). Answer why Marcus doesn't just vibe-code it himself, show on-device Signal vs. Noise filtering, and click **SEND TO DOM'S LIVE BUILDER (:43170)**.

🖥️ **WHAT'S ON SCREEN & CLICK CUES** — SIGNAL VS. NOISE → POST /API/V1/ORGS/MERIDIAN/BUILDS/LIVE

- Point to Marcus Vance's **42-minute** pre/post-call loop (14 calls/wk = **9.2 hrs/wk saved**, **$69k/yr** single-partner value).
- Click **Signal vs. Noise & Stack-Ranker** in the top nav bar to contrast Tier 1/2 noise (0% Airbnb honeymoon texts auto-purged; 8% sports scores ignored) with Tier 4 (98% Partner Call Loop).
- Click the green **Send to Dom's Live Builder (:43170)** button in the top-right header (or Dom clicks ⋯ → `Start` on `:43170`) as you hand off to Dom.

🎙️ **WORD-FOR-WORD SPOKEN TALK TRACK**

• 1:05 – Quantify the High-Value Partner Problem with Marcus Vance

"To see why this is such a high-value problem to solve, look at Marcus Vance—VP of Deal Sourcing at Meridian Crest Capital, a $1.8B private equity firm. Think about the economics of a partner or principal's time: if you save an investment partner even *one hour a week*, that is worth tens of thousands of dollars in deal velocity and carry. Right now, Marcus wastes 42 minutes before and after *every single founder call*—14 times a week—acting as the human copy-paste glue between Outlook, Affinity CRM, a Claude pre-call skill, Granola call notes, and Gemini."

• 1:28 – Why Marcus Can't Just "Vibe-Code" It Himself + Live Handoff to Dom

"Now, a natural question is: *'Why doesn't Marcus just vibe-code an app himself?'* First, Marcus is heads-down evaluating deals—he doesn't even stop to realize his weekly routine *should* be an app. Second, even if someone tries to vibe-code a tool in chat, they get disposable AI slop without the firm's API keys, database connectors, SSO permissions, or UI best practices."

"That's the magic of Heavy Rain: our agentic harness has *better context than any single employee*. On-device, it filters out personal noise—like Marcus texting his fiancée about Airbnb honeymoon villas (0%—auto-purged) or checking sports scores (8%—ignored)—and packages his high-value *thought process + workflow context* (98% score) to hand off to our autonomous Argon builder. Dom, show them what happens when that workflow hits the Heavy Rain console."

BEAT 3 • 2:05 – 3:25 (80 sec) • SPEAKER: DOM

What Our Platform Does: Live Hosted Antigravity Sandbox Build (:43170)

SCREEN: HTTP://127.0.0.1:43170 (BUILD TAB)

FRAMEWORK GOAL (SYNCED TO DOM PUSH 5A968F0): Show the simplified console (`Build | Apps`) with `Meridian Crest Capital` waking up from *"Waiting for work"* into the dark fogbound terrain loop as Google's hosted Antigravity agent (`gemini-4-argon` in a 4 vCPU, 16 GB Linux sandbox) builds **DEALPULSE AUTOBRIEF & POST-CALL LOOP** live!

🖥️ WHAT'S ON SCREEN & CLICK CUES (DOM'S CONSOLE :43170)

ORG: MERIDIAN CREST CAPITAL • TAB: BUILD

- Start on `http://127.0.0.1:43170` on the **Build** tab (starts on **Waiting for work** over the pale mist loop).
- When triggered from `:5173` (or by clicking top-right ⋯ → `Start`), the chamber transitions to the **dark fogbound terrain loop** and displays **Brief handed to hosted sandbox worker** (`gemini-4-argon`, 4 vCPU / 16 GB Linux sandbox).
- Point to the left feed (**Builder steps as they happen**: live thought summaries, plain-word tool calls like *Checking workspace files* / *Writing file*, `Tokens`, and `Files written`) and the right panel (**Background build — Building DealPulse AutoBrief & Post-Call Loop** across 5 phases: `Request received → Reading workflow → Building application → Running final checks → Preview ready`) while the live `index.html` snapshot emerges through the mist.

🎙️ WORD-FOR-WORD SPOKEN TALK TRACK

• 2:05 — Chamber Wakes Up: "Brief handed to hosted sandbox worker"

"Thanks! Here inside the Heavy Rain console, notice how simple the surface is: just *Build* and *Apps*. Right now, Meridian Crest Capital's build chamber is sitting on *'Waiting for work'* in the mist. The moment Marcus's workflow arrives from Heavy Rain, the chamber wakes up on its own."

"Look at what Relay just did: it packaged Marcus's 7-step workflow, his written prompts from Claude and Gemini, our enterprise API contracts, and our UI stylesheet into a single brief—and handed it to Google's hosted Antigravity agent running on `gemini-4-argon` inside an isolated 4-vCPU, 16-gigabyte Linux sandbox."

• 2:40 — "Builder steps as they happen" + 5 "Background build" Phases → Preview Ready

"On the left under *'Builder steps as they happen'*, you are watching the autonomous software engineer's live thought process and tool calls—checking workspace files, wiring the Affinity CRM and Granola data contracts, and writing production files. On the right under *'Background build'*, it tracks the five phases from *Request received* and *Reading workflow* through *Building application* and *Running final checks*."

"Even better than someone vibe-coding a tool themselves, Argon enforces UI best practices, role-based security, and managed API connections out of the box. Every 15 seconds, Relay snapshots the live application behind the mist—and when final checks pass, the fog clears and **DealPulse AutoBrief & Post-Call Loop** is ready to open and added straight to Meridian's *Apps* catalog."

BEAT 4 • 3:25 – 4:10 (45 sec) • SPEAKER: DOM & YOU

Prove It Works (Part 1): DealPulse AutoBrief, Team Reuse & Finance ROI

SCREEN: OPEN APPLICATION (:43170) + APPS TAB

FRAMEWORK GOAL: Prove the generated application works and delivers immediate executive/partner ROI—cutting Marcus's 42-minute scramble to 90 seconds, reusing modules across Elena (68%) & Priya (62%), powering deterministic trial-balance/FX checks in **ROOKMERE CLOSE** (:43173), and saving 36.5 hrs/wk ($274k/yr).

🖥️ WHAT'S ON SCREEN & CLICK CUES

DEALPULSE LIVE ARTIFACT + MERIDIAN APPS CATALOG

- Click **Open application** on the finished **DealPulse AutoBrief & Post-Call Loop** card in Dom's console (:43170) to show the live built application.
- Click **Apps** in the top-left nav of :43170 to show DealPulse AutoBrief & Post-Call Loop registered in Meridian Crest Capital's catalog.
- Highlight cross-team reuse across **Elena Rostova** (68% shared DNA), **Devon Brooks / Rookmere Close** (:43173 trial-balance FX & 3.60x vs 3.75x covenant alerts), **Priya Nair** (62%), and **Claire Sterling's** $274k/yr COO view.

🎙️ WORD-FOR-WORD SPOKEN TALK TRACK

• 3:25 — Click "Open application" on DealPulse AutoBrief & Post-Call Loop

"Let's click *Open application* and prove the output actually works. Here is the live *DealPulse AutoBrief & Post-Call Loop* application that Argon just built for Marcus. Instead of spending 42 minutes copying and pasting across seven tabs before and after his VeloceAI founder call, Marcus gets a zero-click pre-call dossier 20 minutes before his Zoom meeting, one-click Granola transcript synthesis into Affinity CRM, and an instant Investment Committee memo draft—cutting a 42-minute chore down to 90 seconds."

• 3:48 — Org-Wide Context & Reuse Across Meridian Crest Capital ($274k/yr ROI)

"And because Heavy Rain has org-wide context across all of Meridian Crest Capital, it doesn't build five siloed apps for five teammates: when Elena on Growth Equity needs a founder call tool, the system detects a 68% overlap and reuses Marcus's call engine. When principals and controllers run monthly portfolio close in *Rookmere Close*, they get deterministic HGB and SEK/NOK currency variance tables with automated 3.75x debt covenant alerts—eliminating raw chat math errors. Across one 5-person pod, that's 36.5 hours saved every week—$274,000 a year in partner and deal-team capacity."

BEAT 5 (FINALE) • 4:10 – 5:00 (50 sec) • SPEAKER: DOM & YOU

Prove It Works (Part 2): Switch Org to AUGI & Launch 3D Engineering Studio

SCREEN: :43170 (ORG: AUGI) → :43171 SABLE STUDIO

FRAMEWORK GOAL: Prove that Heavy Rain never outputs generic "fast-fashion" AI slop. By switching `Organization` in Dom's console to **AUGI**, show how Argon reads engineers' torsion and mass-balance thoughts and compiles a working **THREE.JS 3D CHASSIS & MASS-BALANCE STUDIO** (:43171).

🖥️ WHAT'S ON SCREEN & CLICK CUES

··· → ORGANIZATION: AUGI → SABLE STUDIO (:43171) & SABLE BALANCE

- In Dom's console (`http://127.0.0.1:43170`), click the top-right ··· menu and switch **Organization** from `Meridian Crest Capital` to `AUGI`.
- Show **Lukas Lindner's** weekly cycle on `Build` (`Run weekly cycle`) and click `Apps` to show AUGI's 4 catalog apps (`Sable Studio`, `Sable Balance`, `Joining Registry` catalog reuse, and `Pack Clearance`).
- Click **Open app** to launch **Sable Studio** (`http://127.0.0.1:43171`): orbit the 3D SUV chassis, compare `SABLE-A` (142 parts), `SABLE-B` (86 parts), and `SABLE-C` (31 parts, `49.8 kN·m/deg`), sweep Wheelbase (`2920–3160 mm`) & Wall Gauge (`2.2–4.5 mm`), drag Exploded View (`0–100%`), and flash **Sable Balance** (`:43171/?app=balance`).

🎙️ WORD-FOR-WORD SPOKEN TALK TRACK

• 4:10 – Switch Organization in Console (:43170) from "Meridian Crest Capital" to "AUGI"

"Finally, we wanted to prove that Heavy Rain doesn't just build finance workbenches or generic AI slop. Because Argon reads the *actual engineering thoughts* of the workforce, it builds purpose-built interfaces matched to the physics of the job. Watch what happens when we open the menu in the console and switch organizations from *Meridian Crest Capital* to *AUGI*—an automotive manufacturer developing the *AUGI Sable* 800-volt electric SUV. At AUGI, Lead Chassis Architect Lukas Lindner and his Body-in-White engineers were prompting Claude and Gemini with closed-box torsion formulas and wheelbase stretches, and getting back flat 1D text tables that couldn't show 3D spatial geometry. Meanwhile, fastener questions are automatically routed to reuse AUGI's existing *Joining Registry* app in the catalog."

• 4:32 – Orbit 3D Chassis in Sable Studio (:43171), Explode Subassemblies & Closing Mic-Drop

"For Lukas's chassis workflow, our Argon sandbox builder compiled *Sable Studio* and *Sable Balance* on `@heavy-rain/organization-3d`—a real-time Three.js spatial engineering studio that works out of the box: engineers orbit and compare `SABLE-A`, `SABLE-B`, and `SABLE-C` megacastings in 3D, sweep wheelbase and wall-gauge sliders live, explode the 5 lower-chassis subassemblies along axial vectors, and check 3D X-ray center-of-gravity axle load shares in *Sable Balance*—with analytical units and non-claims guardrails embedded right beside the numbers."

"Sam Altman said we're entering the 'fast fashion era of SaaS'—but enterprises don't want disposable fast-fashion slop. People shouldn't have to be software engineers to get world-class, sustainable tools. By capturing the thoughts workers are already writing in AI and pairing them with an autonomous Argon software engineer, Heavy Rain builds high-value software that actually lasts and actually works. Thank you!"
